

Proven Effective

With over 20 years of research, Biogents traps are scientifically designed to effectively control mosquito populations, validated by over 400 scientific publications.

Scientific Innovation

Our systems and solutions are lab and field tested to ensure the highest efficacy possible and trusted by professionals worldwide to significantly reduce mosquito populations and nuisance.

Safe & Eco-friendly

Biogents traps offer a non-toxic, pesticide-free solution, ensuring safety for users and the environment by avoiding harmful chemicals.

Number of *Aedes albopictus* collected each week per 1.5 hr human landing collection

Engbrecht C., Gordon S., Venturelli C., Rose A., and Geier M. (2015). Evaluation of BG-Sentinel Trap as a Management Tool to Reduce *Aedes albopictus* Nuisance in an Urban Environment in Italy, Journal of the American Mosquito Control Association, 31(1):16-25.

Science—for your protection.

In collaboration with the Department of Public Health in Cesena, Italy, where the Asian tiger mosquito is widespread, a long-term study was conducted with Biogents traps. Up to 85% less mosquito bites were measured in areas equipped with Biogents traps versus areas without Biogents traps.

Maximizing Catch Rates with CO₂

Biogents outdoor suction/convection mosquito traps armed with BG-Sweetscent imitation human scent effectively attract and catch aggressive tiger mosquitoes. However, the addition of carbon dioxide (CO₂)* mimics human breath and can significantly increase your catch rate by up to 400%** and attracts ALL mosquito species and other blood-feeding insects like biting midges (no-see-ums).

BG-Timer: Scheduled Efficiency

For optimal CO₂ usage, program the BG-Timer up to two distinct gas release intervals per day during peak mosquito activity times, such as dusk and dawn.

- Optimize CO₂ usage to match peak mosquito activity
- Reduce gas consumption and extend refill intervals
- Maintain efficient and effective mosquito control with minimal manual intervention
- Battery powered (9V)

*CO₂ bottle not included

**Compared to using a trap without CO₂

Be a HERO. Catch the BUZZ.

Target Mosquitoes Before They Reach You

The goal is to catch mosquitoes before they bite. During the day, mosquitoes rest in shady, wind-protected vegetation. Placing the trap near these resting areas helps intercept them before they become active again.

TRAP POSITIONING GUIDE

Best Placement Options:

- ✓ Position the trap in shady areas.
- ✓ Place it near sources of humidity, such as rain barrels, puddles, or wells.
- ✓ Set the trap near or within shrubs and bushes.
- ✓ Locate the trap close to mosquito resting areas, such as woodpiles, basements, and drains.

What to Avoid:

- ✗ Do not place the trap in direct sunlight.
- ✗ Avoid windy areas.
- ✗ Don't position the trap directly on decks, patios, or terraces.

How the BG-GAT Works

It is considered a passive trap (requires no power) that attracts females after they have bitten and fed. The BG-GAT prevents egg-laying, reducing future mosquito generations.

- 1 Mosquitoes that want to lay their eggs are attracted by the water and oviposition cues of the trap.
- 2 Once inside the trap, the mosquitoes fly until caught on the sticky cards.

Eliminate Standing Water

The first line of defense against container-breeding mosquitoes is removing or emptying water-holding containers. Empty or completely cover rain barrels; remove old tires; empty plant saucers, and buckets. Regularly check and drain any potential breeding sites—especially after rain.

At Biogents, our purpose is to deliver scientifically proven, safe, and eco-friendly mosquito control systems to reduce the spread of mosquito-borne diseases and promote healthier, more comfortable living environments.
